

PROJECT PROFILE

Troy Boston

Boston, MA

PROJECT OVERVIEW

The south end of Boston continues to be a growth area, and is host to one of the biggest building booms in the region. With 378-units in two towers, the “Troy Boston” luxury apartments is one of the latest projects in this corner of the south end.

PROJECT DETAILS

Precast concrete floors were used for the infrastructure of the 11 & 19 story towers. This created the need for a strong, lightweight floor leveling solution. Our partner NESC was called in for the project, and turned to AccuCrete® for a solution to finish the floors with a durable, level surface.

SOLUTION

To complete the project, NESC selected AccuLevel® H40 poured a total of 8,750 bags (350 tons) throughout the 11 & 19 story buildings. **AccuLevel® H40** provides robust hybrid cement technology with high compressive strengths, all at a very competitive price. Ideal for new but out-of-level precast concrete floors, or old, damaged concrete floors in commercial, institutional, and renovation construction.
